

Experiment 18. Implement a Simple FOPC Parser for Basic Logical Expressions

Program

```
import re
```

```
expression = input("Enter FOPC expression: ")
```

```
pattern = r'([A-Za-z]+\)(([A-Za-z, ]+)\))'
```

```
match = re.match(pattern, expression)
```

```
if match:
```

```
    predicate = match.group(1)
```

```
    arguments = [arg.strip() for arg in match.group(2).split(",")]
```

```
    print("Predicate :", predicate)
```

```
    print("Arguments :", arguments)
```

```
else:
```

```
    print("Invalid FOPC Expression")
```

Output

```
if match:
    predicate = match.group(1)
    arguments = [arg.strip() for arg in match.group(2).split(",")]

    print("Predicate :", predicate)
    print("Arguments :", arguments)
else:
    print("Invalid FOPC Expression")
```

```
*** Enter FOPC expression: Loves(John,Mary)
Predicate : Loves
Arguments : ['John', 'Mary']
```
